```
New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                               invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                 This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The

                                                                                                                                                                                                                                                 invention may allow for accurate and efficient high throughput screening.
The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for analysing a target nucleic acid sequence in a biological material. The method comprises adding at least two nucleic acid primers that hybridise under stringent conditions to predetermined nucleic acid sequences of the target nucleic acid sequences of the target nucleic acid sequence by pcR, and detecting and amplifying the target nucleic acid sequence by PcR, and detecting and quantifying the target nucleic acid sequence. The methods and compositions of the present invention are useful for analysing a target nucleic acid sequence in a biological material by real time PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence. This polynucleotide sequence represents the genomic DNA of a West Nile virus used in the target analysis method
                                   This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitcs, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The

The invention relates to a method of determining (M1) level of contrially active biological pathogens in biological material, involves adding at least two nucleic acid primer pairs to biological material, amplifying target nucleic acid sequences by PCR, and detecting and quantifying target nucleic acid sequences, where quantity of the nucleic acid sequences is proportional to number of biological pathogens in a biological material such as cells, tissues, blood or blood components, proteins, enzymes, immunoglobulins, botanicals, food, ligaments, tendons, nerves, bone, teeth, safin grafts, con marrow, heart valves, cartiage, corneas, arteries, veins, organs, lipids, carbohydrates, callage, norman, arteries, veins, organs, con marrow, heart valves, cartiage, corneas, arteries, veins, organs, lipids, carbohydrates, collagen, chitin and its derivatives, forensic samples, munmified material, human or animal remains, stem cells, white of Langerhans cells, cells for transplantation, red blood cells, white blood cells or platelets. The biological pathogen is chosen from Aspergillus, Candida, Histoplama, Sachoroccus, Sacharomyces, Coccidioides, Cryptococcus, Escherichia, Bacillus, Campylobacter, Helicobacter, Listeria, Clostridium, Streptococcus, Enerococcus, Staphylococcus, Brucella, Hemophilus, Salmonella, Versinia, Pseudomonas, Serratia, Enterobacterium and Coxtella.

Citrobacter, Corymabacterium, Propionibacterium and Coxtella.

California encephalitis virus, Coronavirus, Coxeackievirus, A, Coxeackievirus, Echovirus, Coxeackievirus, Coxeackievirus, Coxeackievirus,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the genome of a strain of West Nile virus (WNV), designated 15-98-5Tl. This strain is a neuroinvasive and neurovirulent strain of WNV. Polymucleotides and polypeptides derived from the 15-98-5Tl genome are useful for diagnosis and prognosis of Flavivirus infection, specifically WNV-mediated encephalitis. They are also useful to raise specific antibodies, for recombinant expression of wNV proteins or peptides (for diagnosis, production of antibodies and identification of specific binding partners in cells), for identifying cellular genes implicated in resistance to viral infection, and for screening for anti-Flavivirus agents
                                                                              ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New neurovirulent strain of West Nile virus, useful in diagnosis and screening for antiviral agents, also related nucleic acids, proteins and
envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus infection caused by DENV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 2741.
                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Deubel V, Guenet J, Drouet M, Malkinson M, Banet

The present invention relates to a method for identifying compounds (I) that can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) is family. The method comprises: (a) inducing expression of the OAS gene in a culture of cells from a non-human mammal (Flvr/Flvr or Flvr/Flvs; indicating resistance or sensitivity to Flavivirus infection); (b) treating cells with test compound; and (c) measuring activity of OAS gene treating infections by Flaviviruss (e), hepatilis C; dengue; yellow fever and various forms of encephalitis). Genomic OAS DNA and derived coDNA, also the encoded proteins, are useful: (a) for treating Flavivirus infection; (b) in screening for anti-flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus infection and their (c) likely response to interferon treatment, e.g. to identify patients at risk of developing severe forms of such infections. The present sequence is West Nile Virus strain NY99-flamingo 382-99 (IS-98-STI) complete

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New diagnostic kit comprising West Nile Virus (WNV) envelope protein reactive with antibody against WNV and cross-reactive with antibody against a flavivirus, useful in diagnosing flavivirus infection caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (B) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against MN and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus infection caused by DENV, WNV, JEV or SLEV. This sequence corresponds to

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus is a RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                         New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West nile virus is a RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening.
                                                                                                                                                                                                                                                                                                                                                                                         New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.

                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                          This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a trarget-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                         New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.

                                                                                                                                                                          The present invention relates to a method for screening for a flavivirus in a subject or animal host. The method comprises: contacting a sample from the subject with a composition compristing a flavivirus envelope protein domain III polypeptide (ADK13683-ADK13701) under conditions that permit formation of specific immunocomplex between an antibody in the sample and the envelope protein domain III polypeptide, and detecting whether a specific immunocomplex is formed. The present sequence is the coding sequence for West Nile Virus protein, from which E protein envelope protein domain III polypeptide (ADK13683) is derived.
animal with a flavivirus envelope protein domain III polypeptide, and detecting formation of a immunocomplex between the envelope protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                note= "OTHER= 2'-methoxyethoxy (2'-MOE) nucleotides"

ô
detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like west Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in elected. The hybridisation assay probes and the kits are useful in flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNN) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of a PCR primer which is related to the
sequence is that of an oligonucleotide probe which is related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.

                                                                                                                                                                              New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                     This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus is an RNA virus that primarily infacts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6

The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                          New Japanese encephalitis virus genomic RNA, useful in developing vaccines for and in diagnosing and treating Japanese encephalitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Japanese encephalitis virus genomic RNA, useful in developing vaccines for and in diagnosing and treating Japanese encephalitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 10968 BP; 3032 A; 2518 C; 3117 G; 2301 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a genomic RNA of the Korean Japanese Bncephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (WTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a

ö
The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranalated region (WTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a genomic RNA of the Korean Japanese Brochhalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (WTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a

The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                               The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West nile virus, with humans and horses serving as incidental hosts. Infection of humans can lead to meningtis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                          1. 19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreaticis, liver failure, hepatocaliuls, meningitis, neurologic infection, hepatitis, liver failure, hepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' and modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; encephalitis; cancer; Cirrhosis; Hammerhead; Inozyme; DNAzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a rarget-complementary sequence of bases, and optionally one or more base sequence that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNM virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                    New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WAV, West Nile Virus, antiinflammatory, cytostatic, hepatotropic, viruoide, neuroprotective; antibacterial; replication; pancreatitis, encephalitis; myocarditis, meningitis; infection, hepatitis; liver failure, cancer, cirrhosis; Hammerhead, Inozyme, DNAzyme;
                                                                                                                                                (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encaphalitis, mandralitis, mentologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules EEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó

                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, waycarditis, meningitis, neurologic infection, hepatitis, neurologic infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention

molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (NNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encophalitis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least that 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleocides and a 3' and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

```
The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for Encating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprises at least tive ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules EEQ ID NO 194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myotacaditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMXzyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least tene of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatits, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis.

Inver failure, hepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleocides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           *****
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis.

encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMXzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least tree of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                  WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Match 35.4%; Score 17; DB 6; Length 17; Local Similarity 70.6%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WWV). The nucleic acid molecules are useful for treating a condition related to WWV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepaticis, not inverfailure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encaphalitis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DMAZyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5 terminal nucleotides and a 3 end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed, however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                    of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, treating a condition related to WNV infection e.g. pancreatitis, incephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                         invention relates to nucleic acid molecules that modulate replication
                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to MNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                        The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (NNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least there of the 5 terminal nucleotides and a 3 end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed, however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

```

nucleic acid molecules are useful for

```
reating a condition related to WNV infection e.g. pancreatitis, encephalitis, wyocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecules.

New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis. WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme; Claim 23; SEQ ID NO 3371; 495pp; English. WNV Inozyme substrate SEQ ID NO 3371. WPI; 2002-706994/76. 

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amborzyme and Zinzyme. The nucleic acid molecule acid molecules further comprise at least five ribose residues, at

least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis, in mocabilitis, myocarditis, meurologic infection, hepatis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nuclecides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least tenz 2.0-omethyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                               The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, pancreatitis, moreobalitis, mycazditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinsyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5 terminal nucleotides and a 3 end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecules.
New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 5 A; 6 C; 3 G; 0 T; 3 U; 0 Other;

(RIBO-) RIBOZYME PHARM INC. (BLAT/) BLATT L. (MCSW/) MCSWIGGEN J A.

Blatt L, Mcswiggen JA;

WPI; 2002-706994/76.

New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

Claim 23; SEQ ID NO 4663; 495pp; English.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatists, encephalitis, myocarditis, meurologic infection, hepaticis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of molecule, in selected from the group of ribozymes consisting of nucleic acid molecules further comprise at least five ribose residues, at least ten 2.0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abastc moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
